

**IMPACT ON YOUR BUSINESS: Easy to Install with Superior Plantability.**

Drivable Grass® offers a simple and reliable solution to storm water management through biofiltration, infiltration, and storage, while not sacrificing valuable site area. The thin-profile, permeable, and flexible concrete paving system promotes superior root penetration and moisture containment beneath the product, resulting in healthy turf. Drivable Grass® is designed to flex and conform. It does not crack and break like rigid concrete or pop up and wear like plastic paving.

Soil Retention's full line of Plantable concrete systems® include:

- Drivable Grass® - a permeable, flexible and plantable concrete pavement system
- Verdura® - a fully plantable retaining wall system
- Enviroflex® - a tapered, vertically interlocking articulating concrete block (ACB) revetment system

Soil Retention's products are manufactured in our primary state-of-the-art 45,000 sq. ft. manufacturing plant located in Riverside County, California on a 10-acre site. Drivable Grass® is also produced in manufacturing plants nationwide.
